

# Disposable Microforceps: ILM

(25 gauge / 0.5 mm)

Article No: 1286.ILMD5

“I’ve recently started using DORC ILM microforceps for my macular surgeries. The working surfaces of this forceps allow for a stable, secure and non-traumatic grip. The precision of its closure allows for gripping at any point of the retina, thus increasing the accuracy of peelings.

During macular hole surgery, the ILM microforceps delivers control in manoeuvrability with ILM flap even near the hole itself, resulting in more precise inverted flap surgery.

The handle, like in all the other DORC instruments, is very ergonomic and easy to use.”
